# Morbidity and Mortality

Weekly Report

## U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE PUBLIC HEALTH SERVICE

Prepared by the

COMMUNICABLE DISEASE CENTER

MElrose 4-5131

For release February 9, 1962

ATLANTA 22, GEORGIA

Vol. 11, No. 5

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED FEBRUARY 3, 1962

INFLUENZA - The epidemic of Influenza Type B which began on the West Coast of the United States and in the Southern part of Florida, subsequently spanning the United States in a broad arc through the Mid-western and Southeastern States, continues a progressive spread through the North and Northeast sections of the country.

Outbreaks of acute febrile respiratory disease indicate active spread of the illness along the Eastern Seaboard from Georgia to Maine, and in the States adjacent to the Great Lakes.

Eight States reported outbreaks of influenza-like disease for the first time this week. Four of these, Connecticut, Maine, Rhode Island, and Virginia, are on the

East Coast; the others are Michigan, Mississippi, West Virginia, and Idaho.

Continuing outbreaks of increased school-absenteeism due to influenza-like disease are reported in new counties from 12 States. In the Northeast these are Maryland, Massachusetts, New York, New Jersey, and Vermont, and in the Great Lakes area, Illinois, Minnesota, and Wisconsin. Spread of the illness was also reported from Kansas, Nebraska, Tennessee, and Florida.

Confirmation of Influenza B outbreaks by isolation or serologic titer rises is reported from six additional States - Connecticut, Massachusetts, Michigan, Mississippi, New Jersey, and New York. A total of 24 States

Table 2. NOTIFIABLE DISEASES OF LOW FREQUENCY

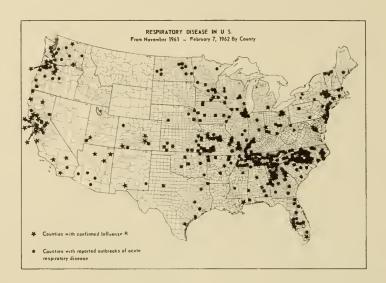

Anthrax:

Botulism:

Malaria: Ariz.-1, Md.-1, N.C.-3, Kans.-1, Calif.-1

Plague:

Psittacosis: Rabies in Man: Smallpox: Typhus, murine:

and the District of Columbia have confirmed Influenza B outbreaks. No Influenza A activity has been confirmed to date.

The number of pneumonia-influenza deaths in 108 cities of the United States decreased during the past week but remained above the epidemic level for the fifth consecutive week.

HEPATITIS – Reported cases of hepatitis for the week ending February 3, 1962, increased to 1,698 cases as compared to 1,508 cases reported the previous week.

POLIOMYELITIS - Seventeen cases of poliomyelitis, 11 paralytic, were reported for the week ending February 3.

Five of the 6 cases reported from New York had onsets in 1961. Two of these late cases occurred in Erie County, two in Jefferson County, and one in Montgomery County. Type I poliovirus was isolated from 4 of these.

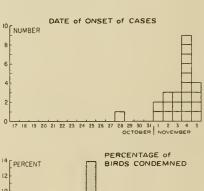

#### EPIDEMIOLOGICAL REPORTS

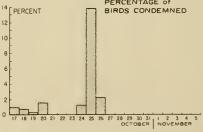

### Psittacosis and Hurricane Carla - Texas

Between October 28 and November 6, 1961, 22 of 92 employees of a poultry processing plant in Texas developed an influenza-like respiratory illness. The disease was characterized by a fever of 10i to 102 degrees, chills, malaise, and cough. There was no evidence of pulmonary complications on X-ray. Eight of the cases were hospitalized for from 3 to 4 days. All cases received tetracycline and became asymptomatic within short periods. Laboratory studies revealed complement-fixation titer rises to psittacosis in 17 of these cases. The epidemic curve below shows one case appearing on the 28th of October and, beginning 4 days later, the remaining 21 cases appearing within a 5-day period.

On October 17, 18, 19, 20, 24, 25, and 26, turkeys from the suspect flock were processed. All employees who became ill had worked on days when this flock was processed. Five apparently healthy turkeys from this flock were autopsied. All birds except one showed pericarditis, epicarditis, and thickening of the air sacs. One bird showed a "plastic exudate" membranous covering over the surface of the liver. Mouse inoculation with material from these four birds revealed inclusion bodies typical of those found with psittacosis.

Although this group of birds appeared to be the source of the human illnesses, the flock had shown no unusual illness patterns until October 22 and 23 when deaths in excess of expected numbers were observed. The following graph shows that an unusually large percentage, 13.8% of birds from the suspect flock, were condemned on October 25:

The highest percentage, on the 25th of October, represents 131 birds (13.8%) condemned from a lot of 951. The epidemic curve is consistent with a common source exposure on the 25th of October for all but one of the human cases.

Investigation revealed that no unusual or undiagnosed illness had occurred in other animals on the premises of the owner of the flock. In addition to wild birds native to the area, however, it was noted that, on September 11, the eye of Hurricane Carla passed directly over the premises. According to the owner millions of birds including sea gulls, pelicans, other sea birds, Spanish doves, and sparrows were seen flying in the eye. For two

or three days thereafter, sea gulls, singly and in small groups, were seen on the premises. It appears conceivable that some of the turkeys in the flock may have originally become infected by sea birds and that the spreading infection took a month and a half to reach epidemic proportions.

(Reported by A. B. Rich, D.V.M., M.P.H., Director of Division of Veterinary Public Health, State of Texas Department of Health, Austin, Texas, Dr. Lawrence Pessarra, D.V.M., M.P.H., State of Texas Department of Health, and Dr. M. S. Dickerson, M.D., T.M.P.H., Epidemiologist, Texas State Department of Health, Austin, Texas.)

#### MORTALITY SUMMARY

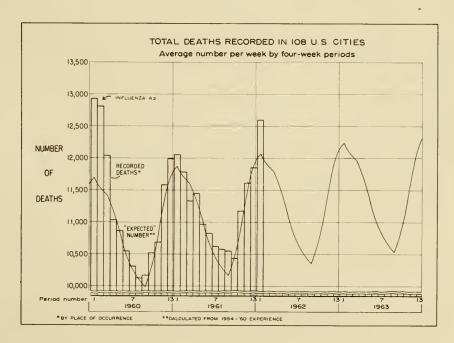

The chart below shows the average weekly number of deaths from all causes at all ages by four-week periods. The last four-week period shown is for the week ending January 13 through week ending February 3.

For this four-week period, the excess mortality for all ages averaged 552, somewhat less than five percent above the expected number. The excess mortality is considerably less than that encountered for a comparable four-week period during the 1960 Influenza  $A_2$  epidemic when the average weekly excess rose to 11 percent above the expected average weekly number.

The table below shows the expected number of total deaths for the recent four weeks and the observed numbers.

TOTAL DEATHS, ALL AGES, RECORDED IN 108 UNITED STATES CITIES

### INTERNATIONAL NOTES - QUARANTINE MEASURES

Smallpox - Europe

England - One new case of smallpox has been reported in England bringing the total number of cases to 22. The new case, in a young boy from Ilkley (Yorkshire - near Bradford) who became ill on January 31, apparently originated from the Bradford Hospital. No additional deaths have occurred.

Germany - Two cases of smallpox, one imported from India and one secondary case, are reported as of February 2 from Monshau Kreis (Land Nordrheinewestfalen). One of the cases (in Lammersdorf) has been confirmed.

This brings to six the total number of cases reported from the Federal Republic of Germany. No additional cases have occurred in Dusseldorf where four cases with one death were reported.

Immunization Information for International Travel

1961 edition - Public Health Service Publication No. 384

Section 5 - The following information on smallpox vaccination for Pakistan supersedes the information in the booklet and in the second paragraph of Identical Memo of the DFQ, dated January 5, 1962, entitled "Smallpox Information for the International Traveler:"

### ASIA - Pakistan, page 47, Section 5

Departing travelers must possess a vaccination certificate valid for 3 months beginning 10 days after a primary vaccination or 3 days after a revaccination.

Section 6 - The following information should be deleted from the list of Yellow Fever Vaccination Centers:

City	Center	Clinic Hours	Fee
California	Tidewater Oil Company	Monday-Friday	No
Martinez	Tel: ACademy 8-1220	1:30 - 2:30 p.m.	

## Smallpox Vaccination Requirements Turkey

Unofficial information was received that a smallpox vaccination certificate of not more than 6 months is required for all air crews and passengers arriving in the country.

### Argentina

Unofficial information was received that a smallpox vaccination certificate of not more than 14 days is required for all persons arriving from Rio de Janeiro, Brazil.

Both reports are being queried.

Notee: These pravisional data are based on weekly telegrame to the Communicable Disease Center by the individual State bealth departments.
